

# *Fogged Windows?*

What causes the glass in insulated windows (double and triple pane units) to get cloudy and/or foggy? The fog comes from the seal between the panes failing. So how do you fix/repair this problem? The only proper solution is to replace the sealed glass unit within the window sash or a complete window replacement. The majority of the time it only requires replacing the glass unit. Don't be fooled by services that say they can repair the unit right at your home. Their solution typically involves drilling holes in the seal between the panes and flushing the glass clean giving the impression of a proper repair. The appearance will be short lived and the insulation value of the window has been destroyed. Remember the only proper solution to this problem is replacing the sealed glass unit. Call us for reputable, fast service for your window repairs.
